subjected to a Laplace transformation and their solutions are discussed. It is found that resonant excitation with linear increase of amplitude with time can occur at certain frequencies depending on the system and the initial disturbance. An equation is derived for the resonant frequencies in excitation by an electron beam of the extraordinary wave propagating parallel to the external magnetic field in an electronic plasma. The excitation of these waves is due to the component of the beam velocity perpendicular to the magnetic field. It is suggested that heating of the plasma electrons can result from such excitation of the extraordinary wave and its subsequent absorption as a result of the thermal motions of the electrons. TITLE: On the linear theory of the excitation of oscillations in a plasma by a charged particle beam

SOURCE: Zhurnal tekhnicheskoy fiziki, v. 36, no. 1, 1966, 191-193

TOPIC TAGS: particle beam, electron beam, plasma beam interaction, plasma oscillation, plasma electron temperature, plasma heating, Maxwell equation, charged particle

ABSTRACT: In this "short communication" the authors briefly discuss the initial stages of the excitation by a charge particle beam of oscillations in a plasma that is of limited extent in the direction of the beam and is located in a uniform magnetic field. The discussion is based on Maxwell's equations and the kinetic equation without collision integral and is limited to times short compared with that required by a plasma particle, owing to its thermal motion, to traverse a distance equal to the wavelength of the excited oscillations. The kinetic equation is first solved by the method of characteristics, and temperature dependent terms are dropped from the resulting expressions for the charge and current densities. After substitution of these expressions for the charge and current densities into Maxwell's equations, the equations are

TITLE: The use of spectral analysis in controlling the process for B  
obtaining pure rare earth element oxides ✓

SOURCE: Ref zh. Khim, Part I, Abs. 4G142

REF SOURCE: Nauchn. tr. Irkutskiy n.-i. in-t redk. met., vyp. 12, 1965,  
13-17

TOPIC TAGS: inorganic oxide, lanthanum oxide, spectrographic analysis

ABSTRACT: Samples of pure rare earth oxides are mixed in 1:1 ratio with powdered carbon to which 4% gallium oxide is introduced. The powders are injected in a hole of a carbon electrode 3.5 mm in diameter and 3 mm deep (Pobedit drills are used). Electrodes are cleaned 15 sec by arc discharge (15 a). Spectra are excited in a direct current arc and simultaneously registered on 2 spectrographs: DFS-13 (1200 lines per 1 mm) and ISP-28. Fe, Al, Ti, Cu, Zr, Ni, Co, V and Ca lines are registered on the diffraction spectrograph; and Si, Mg, Mn, Sb, Pb and Sn on the ISP-28. Sensitivity of the determinations without carrier,  $10^{-2}$  -  $10^{-3}$ %; with carriers, 5 - 10 times higher. NaF is used in place

they designed a new capillary electrode in which the entry of water vapor into the spark gap was reduced (Fig. 2). The solution to be analyzed (2-3 ml) is filled into the glass tube 1 (length 120 mm, inside diameter 5 mm). The upper end of 1 is closed by stopper 2. The solution is held in the glass tube by the atmospheric pressure. The tube bottom is connected via rubber ring with electrode 3 (diameter 5-6 mm, length 15 mm) of a carbon-titanically pure carbon. 3 has a capillary opening, 1 mm in diameter. Tube 1 is fixed in a W-21 (PS-21) tripod. Wires 4 and 5 are connected with the current source. The spark gap is formed between 3 and the vertical electrode 5. The water vapor rises in 1, and arrives at the spark gap in a small quantity only. Table 1 compares the results obtained with this electrode with those of other electrodes. The sensitivity of detection of Au, Sc, Nb, Ge is increased to the 1-5 fold. Exposure time is 45-60 seconds. The probable error of a single measurement is 6-8%. A. K. Ruzakov and L. I. Sosneval'skaya are mentioned. There are 2 figures, 2 tables, and 7 references: 6 Soviet-bloc and 1 non-Soviet-bloc.

TITLE: Increase in sensitiveness in the spectroscopic determination of rare elements in solutions

PERIODICAL: Zavodskaya laboratoriya, v. 27, no. 3, 1961, 306-309

TEXT: In controlling the production of rare metals from mineral raw material it was found that the sensitiveness of determination depended on the kind of introduction of the solution into the spark gap. When the solution was sprayed on by means of a rotating graphite disk (diameter 32 mm, thickness 5 mm), UГ-3 (IG-3) generator ( $C = 0.05$  microfarads,  $L = 0.01$  microhenry, spark gap 3 mm), an increase in the intensity of hydrogen lines 6,563 Å and 1,861 Å was observed with increasing speed of the disk, while the intensity of all metal lines decreased. The high concentration of hydrogen in the plasma was caused by too much water vapor entering the spark gap. The authors studied the influence of H<sub>2</sub> on the line intensity, and took the spectrum of solutions on discharge in air and in hydrogen. On the basis of these results, which confirmed the disturbing effect of water,

same influence on the measuring result of the  $\Delta$  as on the determination of the concentration  $x$ , it can be assumed that

$x = \frac{\Delta}{\Delta'} x'$  (1). References 1,2 demonstrated that (1) is met if  $f_1(C) = nf(mC)$  (2) ( $m$  and  $n$  = constants). If the influence of the chemical composition of the sample causes a variation of the curve inclination, the function between the measured magnitudes has a more complicated character

$\left(1 + \frac{\Delta}{x}\right)^b = \left(1 + \frac{\Delta'}{x'}\right)^{b'}$  ( $b$  and  $b'$  = constants), and the equation (1) can only be applied as an approximation. The approximation will be the greater, the greater the values  $b$  and  $b'$  are, and the less  $\Delta$  is in relation to  $x$ . This version of the method of additions permits the determination with the addition of only one substance and at the calculation a calibrating diagram is being used which was recorded according to the standard samples. The above-described method was applied in the determination of In and Ge in products of ore processing procedures which pro-

AUTHORS: Raykhbaum, Ya. D., Kostyukova, Ye. S. SOV/32-25-8-22/44

TITLE: Application of the Addition Method at the Spectrum Analysis of Ores for Indium and Germanium

PERIODICAL: Zavodskaya laboratoriya, 1959, Vol 25, Nr 8, pp 961 - 963  
(USSR)

ABSTRACT: A new version of the method of additions (Refs 1,2) was developed which is based on the following principle: at the spectra of a sample of a given composition it is possible to represent the correlation of the line intensity with the concentration by the function  $I = f(C)$  (Figure, Curve 1); change of the chemical composition of the sample changes the function  $I_1 = f_1(C)$  (Curve 2). When the composition of the sample is not known and the analysis is effected with (Curve 2) instead of (Curve 1) an error is being made because instead of the real concentration  $x$ , the value  $x'$  is being found. If on the other hand a known quantity  $\Delta$  of the element to be determined is added to the same sample and curve 2 is applied for the determination the resulting value will be the value  $x' + \Delta'$  instead of  $x + \Delta$ . Assuming that the composition of the sample is of the

Ginzburg, Doctor of Physical and Mathematical Sciences; A.B. Mat., S.I. Garey, Tech. Ed.; T.V. Savanyuk.

Purpose: This book is intended for scientists and researchers in the field of spectroscopy, as well as for technical personnel using spectrum analysis in various industries.

Content: This volume contains 177 scientific and technical studies on atomic spectroscopy presented at the 10th All-Union Conference on Spectroscopy in 1956. The studies were carried out by members of scientific and technical institutes and include extensive bibliographies of Soviet and other sources. The studies cover many phases of spectroscopy: spectra of rare earths, electromagnetic radiation, physicochemical methods for controlling vacuum production, physics and technology of gas discharge, spectroscopy and the combustion theory, spectrum analysis of ores and minerals, photographic methods for quantitative spectrum analysis of metals and alloys, spectral determination of the hydrogen content of metals by means of isotopes, tables and atlases of spectral lines, spark spectrographic analysis, statistical study of variation in the parameters of calibration curves, determination of traces of metals, spectrum analysis in metallurgy, thermochimistry in metallurgy, and principles and practice of spectrochemical analysis.

Title : Spectral analysis during the control of concentration processes of ores of non-ferrous metals

Periodical : Izv. AN SSSR. Ser. fiz. 18/2, page 289, Mar-Apr 1954

Abstract : Experimental data are presented regarding the conduct of a spectral analysis during the control of ore concentration processes. Analysis in this case requires complete evaporation of the sample from the cavity of the carbon electrode which results in certain errors. Errors connected with the nonuniformity in the distribution of the metal in the concentration products are of great importance and limit the application of the total evaporation method at small concentrations. Higher concentrations reduce the errors to a permissible limit.

in the aggregate. It was found that the azimuthal width of the interference spots is to some extent reversible in cyclically deformed specimens, which indicates an increase in the degree of perfection of the reflecting crystal and hence also a partial return of its dislocation structure to the original state. As the number of deformation cycles increases, the irreversible component of structural changes increases due to a steady increase in the degree of the blocking of dislocations. A second series of experiments dealt with the cyclic alternated (pulsating) compressive and tensile deformations of specimens of commercial iron and copper, the purpose this time being to determine the variation in the true width of the diffraction lines, and they revealed that in the presence of cyclic deformation this width not only does not decrease but even increases. This is apparently conditioned by the partial back-movement of the dislocations and their partial absorption by the sources. As a deformation cycle is reversed from one pole to the other, the angle of disorientation (flaw in the reflecting grain) in the crystallites of metals (aluminum, iron) decreases. Structural changes of an irreversible nature in unidirectional plastic deformation are greater than in arithmetically balanced cyclic plastic deformation. Orig. art. has: 5 figures, 1 formula.

$$b = \frac{2.1}{\cos(\pi - 2\theta)} \left( 2 \sin \theta \sin \frac{\delta}{2} + \sin \frac{\gamma}{2} \right) \pm S \sin \theta. \quad (5)$$

$A$  denotes specimen-to-film distance;  $\vartheta$  is Bragg angle;  
 $\delta$  is disorientation angle;  $S$  is size of the reflecting  
crystallite; "+" before the second item is applied when  
crystallite reflects divergent beam; "-" when convergent  
beam. Taking X-ray diffraction photographs at various  
distances,  $A$ , will produce adequate data to compute the  
disorientation angle and size of a given crystallite.  
When the conditions under which the photographs are  
taken conform with "+" or "-" before the second item,  
disorientation of a particular minute particle and its  
size can be determined. When photographs are taken under  
the conditions that permit one to disregard  $S$  and  $\gamma$ ,  
the above equation becomes identical with that suggested  
by Hirsch. B. M. Rovinskij is acknowledged for advice

AUTHOR: Kostyukova, Ye. P.

TITLE: Concerning the Relation of the Size of a Diffraction Spot to the Size and Disorientation Angle of a Reflecting Crystallite

PERIODICAL: Kristallografiya, 1959, Vol 4, Nr 6, pp 826-828 (USSR)

ABSTRACT: The size and disorientation angle of crystallites, computed according to B. M. Rovinskij's (Zh. Tekhn. Fiz., 16, 11, 1946) and P. B. Hirsch's (Acta Crystallog., 5, 2, 1952) equations, differ considerably. The author found that the dimensions of diffraction spots, Bragg angle, and camera constants are not the only experimental factors to be counted, but also that convergent angle,  $\gamma$ , of the X-ray beam is an important factor. Thus, analyzing the two equations, rearranging them, and introducing the new factor, a general equation is derived that defines the azimuthal section,  $b$ , of a diffraction spot

The Influence of Cyclic Loading on the Structure of Deformed Pure Metals

reappears. This restoration is greater, the greater the amplitude of the stresses and the smaller the preliminary deformation. No restoration is observed in the X-ray picture of nickel. It is thought that the difference in behaviour occurs because aluminium has a low temperature of recrystallization. The increase in perfection of the subgrains is thought to be a thermal process causing recrystallization "in situ" to take place. There are 7 figures and 10 references, 3 of which are Soviet, 6 English and 1 German.

TITLE: The Influence of Cyclic Loading<sup>b</sup> on the Structure of Deformed Pure Metals

PERIODICAL: Izvestiya Akademii nauk SSSR, Otdeleniye tekhnicheskikh nauk, Metallurgiya i toplivo, 1959, Nr 4, pp 82-87 (USSR)

ABSTRACT: X-ray studies of structural changes occurring in 99.99% aluminium<sup>a</sup> and electrolytic nickel<sup>a</sup> were carried out. Samples were annealed preliminarily deformed to 1, 2 or 4% and subjected to cyclic stressing by bending. X-ray pictures are shown for the annealed sample, the sample after deforming and the sample after various numbers of cycles in Fig 2, 3, 4 and 5 for aluminium and Fig 7 for nickel. The annealed samples of both aluminium and nickel give sharp interference spots corresponding to simple structures with fairly perfect crystallites. After the preliminary deformation the spots are more diffuse because there are subgrains present and the subgrains themselves are not perfect. The behaviour of nickel under subsequent cyclic loading is different from that of aluminium. For aluminium the sharpness of the spots

SOV/180-59-2-10/34

Change in the Substructure of Metals in Repeated Cyclic Loading to the specimen. The substructure was studied by the X-ray back-reflection method using a type BSV-I tube with a copper anode and linear focus (Fig 2). Figs 3 - 7 give patterns obtained after various numbers of cycles (up to 10<sup>7</sup>). Figs 3 and 7 related to aluminium previously annealed at 450 °C tested under repeated and variable sign bending, respectively, and stresses of 1.55 and 1.75 kg/mm<sup>2</sup>, respectively. Figs 4 and 6 related to the repeated bending at stresses of 1.55 and 1.75 kg/mm<sup>2</sup>, respectively, of aluminium previously annealed at 600 °C, and Fig 5 to that of aluminium at a stress of 1.75 kg/mm<sup>2</sup>, previously annealed at 500 °C. The mechanical properties of aluminium with weakly- and strongly-developed substructures were compared: the results showed the superiority of the latter material. The work showed that in cyclic deformation the grain substructure of both aluminium and nickel became more complicated, this occurring in the early stages and ceasing after a definite number of cycles. The changes which occur in cyclically loaded aluminium depend on the nature of the substructure in the original grain; the

ABSTRACT: Increasing attention has been given recently to the  
substructure of crystal grains. Rovinskiy and Rybakova  
(Ref 5) and others (Ref 4) have shown that the yield-  
point strength and hardness increase with decreasing  
sub-grain size. The present work deals with substructural  
changes in 99.99% pure aluminium and electrolytic nickel  
during repeated cyclic loading at 25 cycles/second on a  
type MUP-150 machine. Fig 1 shows the form of the test  
pieces. Aluminium test pieces were annealed for two  
hours at 450 - 500 or 600 °C to obtain weakly- or  
strongly-developed substructures, respectively. Nickel  
test pieces were vacuum annealed for two hours at 900°C.  
The strain during tests was determined with a type  
EIDU-IMASH meter with the aid of wire strain gauges glued

obtained after annealing the deformed specimens for two hours at 250, 300, 350, 400, 500 and 600°C: the lower the deformation the higher the temperature to which the continuous-line background persists. Fig 3 gives a more complete picture (magnification X 2), showing differences in the spot shapes at a given temperature and different deformations and the changes that occur as the temperature is increased. In this figure some vertically-extended spots are visible and to elucidate their origin the authors obtained patterns from specimens rotated through 90° (rolling direction horizontal). This gave spots extended horizontally and the authors conclude that extended spots are due to crystallites in which recrystallization in situ has occurred. They consider that such recrystallization is the primary and main process even at the highest annealing temperature. True primary crystallization becomes appreciable only with increasing deformation. It produces perfect crystals whose structural nature changes with increasing annealing temperature. Fig 4 shows an interference spot from a

TITLE: Change in the Substructure of Cold-Deformed Aluminium in Annealing (Izmeneniye substruktury kholodno-deformirovannogo alyuminiya pri otzhige)

PERIODICAL: Izvestiya Akademii Nauk, SSSR, Otdeleniye tekhnicheskikh nauk, Metallurgiya i toplivo, 1959, Nr 1, pp 55-59 (USSR)

ABSTRACT: On annealing the structure of a deformed metal changes from a thermodynamically unstable to a stable state in two ways: by recrystallization in situ (Refs 1 and 2) or by primary recrystallization (Refs 2 and 3). The authors describe their investigation of substructural changes in 99.99% pure aluminium. A back-reflection X-ray method was used, with a beam from a broad focal spot passed through a very narrow cross-shaped diaphragm. With such diaphragms interference spots from perfect crystals are cruciform; from imperfect crystals complex spots are obtained whose nature and dimensions depend on their substructure. The distribution of spots is shown schematically in Fig 1. Plate specimens were cut from an ingot, annealed at 350°C for two hours and rolled to 5, 15 and 30% deformation. Fig 2 shows the patterns

TITLE: A Simple Method for the Precision Determination of the Lattice Parameters of a Polycrystalline Substance Without an Internal Standard Substance (Prostoy bezetalonnyy metod pertsizionnogo opredeleniya parametrov reshetki polikristallicheskikh veshchestv)

PERIODICAL: Kristallografiya, 1958, Vol 3, Nr 3, pp 382 - 383  
(USSR)

ABSTRACT: For precision back reflection methods, there is some doubt as to the effective specimen film distance which is not removed by using a standard substance as the effective penetration depths are unknown. The ratio of the observed diameters of two rings  $D_1/D_2 = f(a)$  where  $a$  is the lattice period. Values of this ratio of from 1.090 to 1.140 have been already given (Zh.Tekh.Fiz., 1940, Vol 10, p 525) but insufficiently accurately.  $A$  is the effective specimen-film distance.  $D_1/2A = f(a)$ .  $A$  is plotted against  $a$  for the two wavelengths of the K alpha doublet and the value of  $a$  where these curves cross is chosen. If  $D_1$  and  $D_2$  can be measured to 0.01 mm and  $A$  is about 50 mm, then an accuracy of Cardl/2 0.00003 Å can be achieved.

Electrocardiographic data show that acute CO poisoning produces affliction of the myocardium which is originally diffuse and later localized; also that the front wall of the left ventricle is chiefly affected. While benignant and reversible in most cases, changes in the heart may assume

accurately by determining the MLD of the filtrates of broth cultures. The intracutaneous method does not always reveal cultures that produced toxins of low strength and less accurately reflects fluctuations in the toxigenicity of individual strains. As a rule, highly toxicogenic cultures were elicited from diphtheria patients and those that were isolated from carriers varied considerably in degree of toxigenicity, from cultures that did not form toxin to highly toxicogenic ones. The dynamics of toxin formation differed in the investigated cultures: the maximum was reached in 24 and 48 hours and on the 5th day. Orig. art. has: 1 figure and 5 tables.

TITLE: Toxigenic properties of freshly isolated diphtheria cultures

SOURCE: Zhurnal mikrobiologii, epidemiologii i immunobiologii, no. 9, 1965, 36-42

TOPIC TAGS: toxicology, microbiology

ABSTRACT: The main purpose of this investigation was to study the toxigenic properties and dynamics of toxin formation in freshly isolated diphtheria cultures by various methods and to make a comparative evaluation of these methods. The authors used 164 strains of diphtheria cultures isolated in and around Moscow in 1962-1963. The toxigenicity of the cultures was determined by agar precipitation, intracutaneous injection in guinea pigs, and by testing the potency of the toxin in filtrates of broth cultures. The authors establish that the most accurate method of determining the toxigenic properties of diphtheria cultures in vitro is the agar precipitation method since it is highly specific. However, even it did not always permit eliciting toxigenic cultures that slowly produced small amounts of toxin. The flocculation test is less accurate and rather frequently when using this method it was impossible to detect the presence of toxin in the filtrate of broth cultures and to determine its strength. The toxigenic properties of the diphtheria cultures in vivo can be established more

and A-1, 6-7 mm long, were held in sodium-potassium alloy at 700C for 400 hr. Both materials showed a water absorption of 0.03-0.04%, an open porosity of 0.12-0.14%, a bend strength drop of 10%, and a weight loss of less than 0.01%. Both Microlite and A-1 can be used for corrosion-resistant parts for prolonged operation in sodium-potassium alloy at 700C. Such parts are presently undergoing testing in this alloy under dynamic conditions. Orig. art. has: 3 tables. [WW]

TITLE: Testing the stability of corundum ceramics in liquid potassium  
and sodium alloy

SOURCE: Teplofizika vysokikh temperatur, v. 4, no. 1, 1966, 115-119

TOPIC TAGS: corundum ceramic, ceramics corrosion, liquid corrosion,  
potassium sodium alloy, liquid alloy

ABSTRACT: Three corundum-base materials GB-7 (97.09% Al<sub>2</sub>O<sub>3</sub>, 0.92% SiO<sub>2</sub>, 0.08% Fe<sub>2</sub>O<sub>3</sub>, 0.90% CaO, 0.92% B<sub>2</sub>O<sub>3</sub>, 0.09% Na<sub>2</sub>O), Microlite, also known as TsM-332 (99.34% Al<sub>2</sub>O<sub>3</sub>, 0.05% SiO<sub>2</sub>, 0.03% CaO, 0.58% MgO), and A-1 (99.74% Al<sub>2</sub>O<sub>3</sub>, 0.05% SiO<sub>2</sub>, 0.08% MgO, 0.10% Na<sub>2</sub>O) have been tested for their behavior in liquid potassium-sodium alloy. The specimens were prepared from finely ground powders mixed with thermosetting resins by hot pressure casting and two-step firing. The total content of bonding agent after first firing did not exceed 1%. GB-7 showed a 20% strength drop in preliminary tests at 400°C. The specimens of Microlite

TITLE: Effect of irradiation with thermal neutrons on certain electric properties of ceramics from pure aluminum oxide

SOURCE: AN SSSR. Izvestiya. Neorganicheskiye materialy, v. 3, no. 1, 1967, 94-100

TOPIC TAGS: corundum refractory, thermal neutron, irradiation effect, aluminum oxide, oxide ceramic, radiation damage, electric property

ABSTRACT: The effect of thermal neutrons on the radiation resistance and electric parameters of corundum ceramics was studied. Analysis of the nuclear reactions taking place (formation of the short-lived  $O^{19}$  and  $Al^{28}$  isotopes) shows that corundum can be recommended for use in thermal neutron fluxes. It is shown that only very high integrated thermal neutron fluxes of the order of  $10^{21} n/cm^2$  and higher have a very substantial effect on the electrophysical parameters of corundum: the electric conductivity, dielectric constant, and the dielectric loss factor and loss tangent are increased. This effect may cause a considerable decrease of the insulating properties of corundum. Such radiation defects are stable and are not annealed at high temperatures.
